We are choosing a dataset of soccer matches from Hudl Statsbomb, which can be found at https://github.com/hudl/open-data. There are thousands of matches in the dataset so we believe it is large enough for machine learning analysis.

We are choosing this dataset because we all share a passion for soccer. We think the dataset is rich and can provide interesting insights. In addition to providing basic information like match scores, the dataset contains information about the matches like referees, managers, week numbers, leagues, and much more.
